

Controlling Air Pollutants in Multi-Unit Housing

Asthma is more common among renters receiving housing assistance.

About twice as many more people who live in public housing report having asthma than the general population.

Steps to Controlling Indoor Air Pollution

1. Enact a smokefree policy for the entire property including indoor spaces and outdoor spaces.
2. Test all units for radon and fix if elevated levels exist.
3. Fix leaks and drips to prevent the growth of mold.
4. Fit kitchens with an exhaust fan that moves air outside the building.
5. Vent clothes dryers to the outdoors.
6. Use integrated pest management strategies to control infestations.
7. Install carbon monoxide monitors and inspect twice annually.
8. Use low or no-VOC products when cleaning, renovating and during construction.
