

# QUESTIONS FOR YOUR DOCTOR

## Am I eligible for an approved lung cancer immunotherapy drug?

Currently, FDA approved lung cancer immunotherapy drugs are for patients with non-small cell lung cancer that has spread or grown after they have tried a chemotherapy that contains platinum. Before trying immunotherapy, your doctor may also want to test your tumor to see if it contains PD-L1. Health conditions, like auto-immune diseases, might make it unsafe for you to be on immunotherapy.

There are two FDA approved lung cancer immunotherapy drugs: nivolumab (Opdivo®) and pembrolizumab (Keytruda®). Ask your doctor if you are eligible for either of these drugs.

## Is a lung cancer immunotherapy clinical trial right for me?

There are promising lung cancer immunotherapy treatments being studied in clinical trials. Ask your doctor if any ongoing trials are the right treatment option for you.

## How can we work together to manage my side effects?

Many people on immunotherapy report fewer side effects than traditional chemotherapy. However, there can be some very serious side effects associated with immunotherapy, like inflammation of the organs. Close monitoring is important. Ask your doctor what signs and symptoms you should watch for and what to do.

## Will it work for me?

Some patients respond very well to immunotherapy, while others do not have the same positive result. No one can predict how your body will respond to any one treatment. Work with your doctor to understand what you can expect while on an immunotherapy drug, and if it is the right choice for you.
