Being a current or former cigarette smoker increases the risk for severe illness from COVID-19.¹

- Cigarette smoking compromises the immune system, is linked to lung inflammation and puts people at greater risk for pulmonary infection.²
- Smoking harms the airway lining cells that contain cilia³, which are our essential defenders against viruses like SARS-CoV-2.
- People who smoke have more ACE2 receptors in their lungs. The virus that causes COVID-19 uses these receptors as a ‘doorway’ to get into lung cells, thus allowing for more severe illness from the virus.⁴

Both smoking and COVID-19 disproportionately impact racial, ethnic, and sexual minority groups.⁵,⁶

- Communities that bear a disproportionate burden of COVID-19 hospitalizations and deaths include:⁷
  - American Indians and Alaska Natives
  - Black Americans
  - Hispanics or Latinx Americans
- Current cigarette smoking is highest among:⁸
  - Non-Hispanic American Indians and Alaska Natives
  - People of multiple races
  - LGB Americans

This pandemic is exacerbating the consequences of racial and socioeconomic disparities in health and healthcare in America – creating a crisis within a crisis.

There are persistent inequities in resource allocation, access to healthcare and other health stressors that communities of color experience.⁹

*Severe illness from COVID-19 is defined as hospitalization, admission to the ICU, intubation or mechanical ventilation, or death*
At the present time, no firm link has been established between e-cigarette use and more severe risk due to COVID-19, but other harms remain.

Most e-cigarettes contain nicotine, which has several known health effects, including causing inflammation in lung tissue.\(^{10}\)

E-cigarette aerosol can contain heavy metals like lead, volatile organic compounds and cancer-causing chemicals that are harmful to the lungs.\(^{11}\)

E-cigarettes contain acrolein, a pesticide. Acrolein can cause acute lung injury and COPD and may cause asthma and lung cancer\(^{12}\) – all four are potential risk factors for developing more severe COVID-19 symptoms.\(^{13}\)

Secondhand smoke has not been established as a separate, known risk factor in developing more severe COVID-19 symptoms.

- Secondhand smoke is a serious health hazard which causes over 41,000 deaths in the U.S. each year.\(^{14}\)
- Many of the underlying conditions caused or made worse by secondhand smoke are potential risk factors for developing more severe COVID-19 symptoms.\(^{15}\)
- 100% smoke-free environments are the only effective way to fully protect people from secondhand smoke exposure.\(^{16}\)
  - Smoking indoors can increase the transmission risk of COVID-19 because people would need to take their mask off to smoke and respiratory droplets could be transferred when a smoker exhales.

With smoking being firmly linked to more severe disease from COVID-19, there has never been a better time to quit.

- Smoking cessation improves health status and enhances quality of life.\(^{17}\)
- Smoking cessation medications approved by the FDA and behavioral counseling can double the chances of quitting smoking.\(^{18}\)
- When people quit smoking, the number of ACE2 receptors in a person’s lungs decreases.\(^{19}\)

The Lung Association supports:

- Continued research studying the link between tobacco, including e-cigarette use, secondhand smoke and increased risk for severe illness from COVID-19.
- Making all public places, including casinos, smokefree to decrease the chance of getting COVID-19.
- Removing barriers to achieving health equity so that everyone has a fair opportunity to be as healthy as possible.
- The ‘Quit Because of COVID’ Act, which, if passed will give all Medicaid enrollees access to a comprehensive quit smoking benefit without cost-sharing.
- Funding state tobacco control programs at CDC recommended spending levels.
